

Credit Card Application System

Hackathon: 31-Jan-26

Credit Card Application: Business Workflow

Business Considerations & Validations

- Applicant must be greater than **18 years age**
- There should **not be any other previous application that was Approved / Rejected** for the same Applicant in the **last 6 months**
- Credit Score must be **automatically retrieved** based on PAN card details
- Credit Limit should be
 - If **Annual Income $\leq$ INR 2,00,000**, Credit limit should be **INR 50,000**
 - If **Annual Income $>$ INR 2,00,000 AND $\leq$ INR 3,00,000**, Credit limit should be **INR 75,000**
 - If **Annual Income $>$ INR 3,00,000 AND $\leq$ INR 5,00,000**, Credit limit should be **INR 1,000,000**
 - **Greater than INR 5,00,000** – Credit limit will be subjective
- At any point of time, Applicant must be able to **see the application status using application number**

Architecture & DevOps Considerations

- Design a scalable architecture separating frontend, backend, and data layers
- Implement proper error handling and logging
- Ensure secure data flow between frontend and backend
- Set up a cloud-based NoSQL database instance
- Configure environment variables for sensitive information
- Follow Regulatory Compliance

Technical Requirements

1. Front-end

- ReactJS/ NextJS
- Basic styling with CSS modules or Sass

2. Backend

- Node.js with Express.js / Python Django / JSON server for the API
- NoSQL database of choice (e.g., MongoDB, DynamoDB, Firestore)

3. Authentication

- JWT for secure user sessions

4. API

- RESTful API for communication between frontend and backend

5. Cloud Deployment

- Deploy frontend and backend to cloud platforms of choice
- Set up basic environment variables for configuration

6. CI / CD

- Implement a basic GitHub Actions workflow for automated testing and deployment
